

Resilient New Mexico

AI-Powered Energy Siting Map

The Problems

Risk

Opportunity

≠

Problem 1

New Mexico faces **drought, wildfire, and flash floods**.

Problem 2

Data is siloed — static PDFs, spreadsheets, no real-time context.

Problem 3

Fusion and renewables are expanding fast & Planners can't see **risk + energy + community** together.

Solution

Interactive **LIVE** FEMA-based map

Switch layers: risk → solar → wind → fusion

Scenario simulation (drought, storm)

AI explains “why this site works or not”

Our tool combines FEMA’s National Risk Index with county and tribal data.

You can switch between **risk layers** or **energy layers** — solar panels (black), wind turbines (purple), and fusion (green).

When you hover, our AI explains why an area is strong or risky for development.

FEMA Risk + Renewable Potential + AI Recommendations

TECHNICAL SIDE (Under The Hood)

Built in **Flask + Leaflet**

GeoJSON merges FEMA + renewable/fusion data

Dynamic hazard simulation: drought ↔ flood ↔ fire

AI API: recommends mitigation or site choice

Intertwining Risk & Opportunity

IMPACT & VISION

Planners: see risk & mitigation in seconds

Developers: find ideal fusion/renewable sites

Communities: get plain-language AI guidance

Expand → real-time weather data + national coverage

Also: Serves as a Reliable FEMA Data Backup
